Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                            The present sequence is that of a single chain Fv (scFv) derivative of antibody 193/K2, comprising the heavy (VH) and light (VL) chain variable regions of 193/K2 comprising the heavy (VH) and light (VL) chain variable scFv was obtained by PoR amplification of cDNAs for 193/K2 whand VL regions and cloning in vector pDAP2. 193/K2 is an example of anti-human Practor IX (FIXA) Activated Factor IX (FIXA) antibodies of the invention. Anti-FIX/FIXa and their derivatives, including scFv and CDR3 fragments, have Factor VIIIa (FVVIIIa) cofactor activity or FIXa activating activity. Administration leads to an increase in the proceagulant activity of FIXa, even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood claimed pharmaceutical composition for treating patients with blood

This sequence represents the heavy and light chain Fv region of murine MAD 33. The first anino acide encoded by the cloned heavy chain Fv gene is Asp instead of Glu due to the primer used - at nucleotide poss. 456-465 is the region where the Pock cloning artifact was repaired. The coding sequence encodes the same amino acids as the original B3 L chain sequence encodes the same amino acids as the original B3 L chain artigen present on many carcinoma cells and may be useful for the artigen present on many carcinoma cells and may be useful for the reconnected by a flexible linker (Gly4Ser)3. The coding gene can also be fused to sequences encoding two different truncated forms of the PE molecule to obtain single chain B3[Fv] immunotoxins. (Note: Revised entry submitted to correct the patent number format of Growenment-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. The www.derwent.com/dwpi/updates/ntis_us.htmi.) (Updated on 25-MAR-2003 to correct PP field.)

protein or antibody comprising the Fv region of both the light and heavy chains of an antibody (Ab) fused together, and an effector molecule, where the fusion protein or Ab has the binding specificity of monoclonal Ab (MAb) B1, B3 or B5, can be used for the production of such fusion proteins or antibodies. The fusion proteins can be used in compositions as an immunotoxin to inhibit tumour cell growth. The single chain antibody can be used to detect the presence or absence of cells bearing a custing (Y) carbohydrate antigen in a patient. The antibodies are also useful as multiple targetting moieties, providing at least 2 kinds of biological activity. They can also be used in diagnostic assays and for the inaging of tumours when attached to a radiolabel and for the patient than the mouse MAbs B1, B3 and B5, making them more suitable for long term treatment

Oxazalone is a hapten used for studying the immune response and the anti-
oxazalone antibody. NQ11, has been described by E. Gheradi, R. Pannell,
and C. Milstein, (J. Immunol. Method 126 (61-68). A plasmid contg. the VH
and VL genes of NQ11 was converted to the scFv form by inserting the
BStEII/SacI fragment of scFvDI.3 myc (nucleotides 432-499 of AAQ21096)
between the VH and VL genes to generate pscFvNQ11 (protein sequence shown
here). This scFv was cloned into FdTps/Xh (see AAQ21095) to generate pAB
NQ11. The specific binding of pAB NQ11 was confirmed by ELISA. See also

```
The present sequence is that of a single chain FV (SCFV) derivative of antibody 198/A1, comprising the heavy (VH) and light (VL) chain variable regions of 198/A1 joined by an artificial, flexible linker peptide. The SCFV was obtained by PCR amplification of cDNAs for 198/A1 WH and VL regions and cloning in vector pDAP2. 198/A1 is an example of anti-human pactor IX (FIXA) Activated Pactor IX (FIXA) antibodies of the invention. Anti-FIX/FIXA and their derivatives, including scFv and CDR3 fragments, have Factor VIIIa (FVIIIa) cofactor activity or FIXA activating activity. Administration leads to an increase in the proceagulant activity of FIXA, even in the presence of FVIIIa inhibitors patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood claimed pharmaceutical composition for treating patients with blood claimed pharmaceutically haemophilia A and haemorrhagic

   The anti-dansyl single chain antibody was produced using PCR to join two variable regions by overlap extension. A flexible linker region consisting of three gly-gly-gly-gly-gly-ser repeats was used to connect the terminus of the heavy chain variable region (Vh) and the N-terminus of the light chain variable region (Vl) in order to maximise flexibility while minimising steric hindrance during protein folding. For the PCR reaction, the 3' primer for Vh (AAA@86751) and the 5' primer for Vl (AAA@86752) were designed to have a complementary region in the linker portion. The Vh and Vl regions were independently amplified, followed by a second PCR reaction in which these products were used as templates. The complementary sequences in the linker were hybridised, joining the V regions and two primers (AAA@86734, AAA@8754) were then used to amplify the single chain antibody. (Updated on 25-MAR-2003 to correct PN field.)

the heavy (VH) and light (VL) chain variable regions of 198/B1 joined by an artificial, flexible linker peptide; a spacer; Bscherichia coli alkaline phosphatase; and a C-terminal 6His affinity tail. 198/B1 is an example of anti-human Factor IX (FIX) activated Factor IX (FIXa) antibodies of the invention. Anti-FIX/FIXa antibodies and their FIX activatives, including serv fragments, have FVIIIa cofactor activity or FIXa activating activity. Administration leads to an increase in the procoagulant activity of FIXa, even in the presence of FVIIIa inhibitors. FVIIIa, allows for rapid blood coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic diathesis. The screwalkeline phosphatase was expressed in E. coli. It exhibited FVIII-like activity

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                            The present sequence is that of a single chain FV (scFV) derivative of antibody 198/AB2, comprising the heavy (WH) and light (VL) Chain variable regions of 198/AB2 joined by an artificial, flexible linker peptide. The scFV was obtained by PCR amplification of CDNAs for 198/AB2 WH and VL regions and cloning in vector pDAP2. 198/AB2 is an example of anti-human Factor IX (FIXA) antibodies of the invention. Anti-FIX/FIXA and their derivatives, including scFV and CDR3 fragments, have Factor VIIIa (FYVIIa) cofactor activity or FIXA activating activity. Administration leads to an increase in the procoagulant activity of FIXA, even in the presence of FVIIIa inhibitors. This allows for rapid blood coagulation even in the absence of FVIII or FVIIIA, and in the case of FVIII inhibitor patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic

The present sequence is that of a fusion protein comprising: a PelB leader; a sincle chain Fv (SEP) derivative of antibody 198/B1 comprising the heavy (VH) and light (VL) chain variable regions of 198/B1 joined by an artificial, flexble linker peptide, a spacer; a Myc-tag peptide; a spacer; and a C-terminal 6His affinity tail. 198/B1 is an example of anti-human Pactor IX (FIX)/activated Factor IX (FIXA) antibodies of the invention. Anti-FIX/FIXA antibodies and their derivatives, including scFv fragments, have FVIIIa offactor activity or FIXA activating activity. Administration leads to an increase in the proceagulant activity of FIXA, even in the presence of FVIII or FVIIIa, and in the case of coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood diabrhesis. The scFv-myc-tag fusion was expressed in E. coli. It exhibited FVIII-like activity

   The present invention relates to fusion proteins containing a single chain antibody (sFv) in place of a modular protein binding domain (MPBD), or an antibody epitope in place of the linear binding epitope for a MPBD. The fusion proteins can be used in assays to identify protein-protein interactions. The present sequence is the protein sequence for 3DX antibody, 3DX is derived from 9B10. 3DX was used in the method of the
   New fusion proteins, useful for validating protein-protein interaction causing a specific biological activity, comprises a single chain antibody instead of a modular protein binding domain.

  The present sequence is that of a single chain FV (scFV) derivative of antibody 197/K2, comprising the heavy (WH) and light (VL) chain variable sequence of 193/K2 joined by an artificial, flexible linker peptide. The scFV was obtained by FCR amplification of cDNAs for 193/K2 H and VL regions and cloning in vector pDAP2. 193/K2 is an example of anti-human Factor IX (FIXA) antibodies of the invention. Anti-FIX/FIXa and their derivatives, including scFV and CDR3 fragments, hamistration leads to an increase in the procoagulant activity of FIXa, even in the presence of FVIIIa inhibitors. This allows for rapid blood coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic

  Anti-epidermal growth factor receptor (EGFR) single chain antibodies and antibodies constructed from anti-EGFR antibody fragments can be used for diagnosis of tumnours and assessment of tumnour growth in vitro and in vivo. They may also be used in a pharmaceutical competion for the therapy of e.g. melanomas, gliomas and carcinomas. The antibodies and fragments are derived from mice but are humanised so as to cause minimum reaction against them. They are produced using the phage antibody library. They are produced using the phage antibody AAR104011-T04026 and AAR79858-R79873)

   This invention describes a novel vaccine (VI) against conformation-dependent antigens (CDA) comprising DNA (I) and/or an antibody, or peptide which immunologically initates CDA, is new. (I) encodes a region of an autilidiotypic antibody (Ab2) or another peptide which: (a) specifically binds to the binding site of an antibody (Ab1) or an antigen binding molecule; and (b) immunologically mimics the initial antigen. The
   Vaccines against conformation-dependent or non-peptide antigens, based on DNA encoding peptide which mimics the antigen, useful e.g. as antitumor

The present invention describes a dual-specific ligand (1) comprising:

(a) a first single immunoglobulin variable domain with a binding

CC specificity to a first antigen or epitope; and (b) a second complementary

immunoglobulin single variable domain with a binding activity to a second

antigen or epitope. The binding domains are mutually complementary, and

cantigen or specificity. (1) has cytostatic, anti-HIV, antianaemic,

cantiinflammatory, immunosuppressive and neuroprotective activities. The

dual-specific ligand is useful for treating, preventing or diagnosing

cdiseases, e.g. cancer, HIV infection, hepatitis, rubella, anneania,

cinflammations or autoimmune disorders (e.g. multiple sclerosis, Crohm's

disease or myasthenia gravis). The dual-specific ligand may be used to

recruit cytocoxic T-cells to a cancer cell. The dual-specific ligand is

also useful for monitoring the efficacy of drugs, as well as for

monitoring toxicity. The present sequence represents a human serum

albumin (HSA) related antibody sequence, which is used in an example from

  The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertorize of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in diagnostic, prophylatic and therapeutic procedures. The present sequence represents the single chain antibody (ScPv) that forms the basis of a library according to the

component existing in the organ of interest in several forms. The ligands do not bind to the stalk or the most abundant form of the secretory component present in the organ under physiological conditions. The ligands are useful for transporting therapeutic or diagnostic campositions into or across cells expressing pIgR, useful to introduce or transport ligands such as antibodies and/or to deliver biologically cative components such as proteins, nucleic acids or detectable labels. They are used to deliver therapeutic compositions to mucosal surfaces cuch as the gastro-intestinal tract, respiratory system etc. in humans. They are also useful to label cells expressing pIgR, e.g. to distinguish epithelial cells from a mixed cell population in pathology studies or to carcinomas relative to normal epithelium). They can also be used to deliver veterinary compositions, especially in mammals such as farm, consumption. The present sequence represents the amino acid sequence of secreted form of scFv 4A

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TMF) super family and induces B cell tumour necrosis factor (TMF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases. e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABB43290-ABB4728 represent the antibodies and fragments of the antibodies described in the method of
   Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

I- FUNCTION: Catalyzes the formation of alpha-ketobutyrate from
threonine in a two-step reaction. The first step is a dehydration
of threonine, followed by rehydration and liberation of ammonia.

The L2:2253-2258(1981).
-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21-JUL-1986 (Rel. 01, Created)
28-JUL-1986 (Rel. 01, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
Genome polyprotein B [Contains: Protease cofactor; Membrane binding protein; VPG; Protease (EC 3.4.22.-); RNA polymerase (EC 2.7.7.48)].
Composa mosaic virus (CPW).
Viruses; ssRNA positive-strand viruses, no DNA stage; Comoviridae;
-!- CATALYTIC ACTIVITY: L-threonine = 2-oxobutanoate + NH(3).
-!- COFACTOR: PYITIGACAL phosphate (By similarity).
-!- PATHWAY: Isoleucine biosynthesis; first step.
-!- SATHWAY: Belongs to the serine/threonine dehydratase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PYRIDOXAL PHOSPHATE (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         forms of AdoMet synthase designated as alpha, beta, and gamma. Alpha and beta are expressed only in adult liver, while gamma is widely distributed in extrahepatic tissues.

J. Biochem. 250:653-660(1997).

LE BLY. J. Biochem. 250:653-660(1997).

-!- FUNCTION: Catalyzes the formation of S-adenosylmethionine from methionine and ATP.

C. -!- CATALYTIC ACTIVITY: ATP + L-methionine + H(2)O = phosphate + diphosphate + S-adenosyl-L-methionine.

C. -!- COPACTOR: Binda 2 divalent ions, such as magnesium or cobalt, and 1 potassium ion per subunit (By similarity).

C. -!- COPACTOR: Binda 2 divalent ions, such as magnesium or cobalt, and 1 potassium ion per subunit (By similarity).

C. -!- SUBUNIT: Homodimer.

C. -!- SUBUNIT: Homodimer.

C. -!- SUBUNIT: STREARESAIC INSUBS, THERE ARE THREE DISTINCT FORMS OF ADOMET SYNTH. DESIGNATED AS ALPHA, BETA, AND GAMMA. IS WIDELY FORMS OF ADOMET SYNTH. DESIGNATED AS ALPHA, BETA, AND GAMMA IS WIDELY DISTRIBUTED IN EXTRAHEDATIC TISSUBS. IN ADDITION THE GAWMA FORM PREDOMINANTLY EXIGTS IN FETAL RAT LIVER AND IS PROGRESSIVELY REPLACED BY THE ALBHA AND BETA FORMS DONING DEVELOPMENT.

C. -!- SIMILARITY: Belongs to the Adomet synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Merazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence (

Patent No. 6338114
GENERAL INFORMATION:
APPLICANT: Person, Mats A. A.
TITLE OF INVENTION: HUMAN MONOCLONAL ANTIBODIES SPECIFIC FOR TITLE OF INVENTION: HEPATITIS C VIRUS (HCV) E2 ANTIGEN
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:
ADDRESSEE: REED & ROBINS
STREET: 285 Hamilton Avenue, Suite 200
CITY: Palo Alto
STRATE: California
CONNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB 4; Length 107;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                        ZIP: 94301

(CDR3) of an antibody having anti-Factor IX (FIX) or anti-activated Factor IX (FIXa) activity. Such antibodies and their derivatives (including those that comprise the present CDR3 peptide) have Factor VIII of Factor activity or FIXa activating activity.

Administration of the antibodies or their derivatives leads to an increase in the procoagulant activity of FIXa, even in the presence of FVIII inhibitors. This allows for rapid blood coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies or their derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic diathesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New factor IX/factor IXa antibodies and their derivatives useful for increasing amidolytic activity of factor IXa, and for treating blood coagulation disorders such as hemophilia A and hemorrhagic diathesis.

The present sequence is that of a single chain FV (scFV) derivative of antibody 193/AD3, comprising the heavy (WH) and light (VL) chain variable regions of 193/AD3 joined by an artificial, flexible linker peptide. The scFV was obtained by PCR amplification of cDNAs for 193/AD3 WH and VL regions and cloning in vector pDAP2. 193/AD3 is an example of anti-human factor IX (FIXX) Activated Factor IX (FIXX) antibodies of the invention. Anti-FIX/FIXa and thair derivatives, including scFV and CDR3 fragments, have Factor VIIIa (FVIIIa) cofactor activity or FIXa activating activity Administration leads to an increase in the proceagulant activity of FIXa, even in the presence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies and derivatives are used in a claimed pharmaceutical composition for treating patients with blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of complementarity determining region 3 (2DR3) of the heavy chain of an antibody expressed by mouse hybridoma 193AD3. This antibody has anti-Factor IX (FIX) or anti-activated Factor IX (FIXa) activity. It is an example of anti-FIX/FIXa antibodies of the invention. Such antibodies and their derivatives (including those that accipate the present CDR3 peptide) have Factor VIIIa (FVIIIa) cofactor activity or FIXa activating activity. Administration of the antibodies or their derivatives leads to an increase in the procoagulant activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New factor IX/factor IXa antibodies and their derivatives useful for increasing amidolytic activity of factor IXa, and for treating blood coagulation disorders such as hemophilia A and hemorrhagic diathesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Factor IX; FIX; Factor IXa; FIXa; antibody; procoagulant; Factor VIII offactor; blood coagulation disorder; haemophilia A; haemorrhagic diathesis; haemostatic; anidolytic; therapy; mouse; complementarity determining region; CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

              blood coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies or their derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of the CDNA clone Bcl-like (HAICH29), used in the method of the invention. The products of the clone can be used for treating conditions associated with abnormal expression of the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory diseases, various allergies, and as anti-infectious agents. The products can also be used for detection and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotides and encoded polypeptides - used to develop products for treating e.g. inflammatory diseases, infections, immunological disorders, autoimmune diseases, allergies or tumours.
   This allows for rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BC1-like (HAICH29); chronic inflammatory disease; allergic reaction; immunological disorder; autoimmune disease; anti-infectious agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   22-AUG-1997
                                                                                                                                                                                                                13-JUN-1
```

```
The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 cDNA sequences also given in the specification. The protein is used in a sequences also given in the specification. The protein is used in a comparation condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include catching in e.g. rheumatoid arthritis, hyperpoliferative disorders e.g. rheumatoid arthritis, hyperpoliferative city cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The polypeptides can also be used to aid wound the city and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to collypeptides can also be used as a food additive or preservative to carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents one of the novel human compared the invention components of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human, secreted protein; hyperproliferative disorder; leukaemia;

New genes and its encoded prostate cancer antigen proteins, useful for preventing, treating, ameliorating or diagnosing e.g. prostate cancers, thymic hypoplasia, multiple sclerosis, AIDS, angina pectoris or cerebral Ferrie AM; CL, Ebner R; Zeng Z, Kyaw H; WPI; 2003-521800/49.

## Claim 3; Page 59; 260pp; English.

The present invention relates to the isolation of novel human secreted proteins and the polynucleotide sequences encoding them. The invention also discloses vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The polypeptide and polynucleotide sequences for the secreted proteins are useful for preventing, treating, ameliorating or diagnosing medical conditions such as hyperproliferative disorders (e.g. leukaemia or breast cancers), wounds, reproductive disorders, blood-relat disorders (e.g. haemophilia or thrombocytopaenia), immunodeficiencies (e.g. haemophilia or thymic hypoplasia), autoimmune disorders (e.g. graft-versus-host disease,

The present invention relates to human immunopolypeptides, produced by a phage transfected cell library. The present sequence is one such immunopolypeptide. The immunopolypeptides have binding specificity for envelope glycoprotein E2 and nonstructural protein NS3 of hepatitis C virus (HCV). E2 glycoprotein is believed to be responsible for target cell binding and contains neutralising epitopes, while NS3 is thought to be involved in the replication of HCV. The immunopolypeptides are useful HCV infection

Sequence 132 AA;

```
The invention relates to an isolated polynucleotide, which encodes a fatty acid CoA ligase-like AMP-binding enzyme (FACLIABE) polypeptide. The PACLIABE polynucleotide and polypeptide are useful for identifying test compounds, which may act as agonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. The vectors comprising the polynucleotide and the reagents are useful for modulating the activity of FACLIABE in a disease, e.g. obesity, diabetes, a central nervous system disorder, a genticurinary disorder, cancer, a cardiovascular disorder, or a genticurinary disorder. These diseases include Alzheimer's disease, Parkinson's disease, pain, colon tumor, pre-esophageal dysphagia, gastrifits, ulcers, lymphoma, Kaposi's sarcoma, urinary incontinence, pelvic pain, lupus nephritis, erectile dysfunction, ovary tumour, lung tumour, thyroid tumour, carcinoma, congestive heart fallesses. These are also useful for preventing or ameliorating the above mentioned diseases. Sequences ABR82455-47 represent FACLIABE related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                           vaccine
    RESULT 10
                         AAB66460
                                                                             The present invention describes a human fatty acid CoA ligase-like AMP-binding enzyme (I). (I) has nootropic, neuroprotective, analgesic, antianaemic, immunostimulant, anorectic antianaemic, immunostimulant, anorectic and antidiabetic, and can be used in gene therapy. (I) polynuclectides and polypeptides can be used for identifying test compounds, that may act as agonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. Vectors comprising the polynuclectide can be used in the preparation of a medicament for modulating the activity of (I) in a disease, particularly obesity, disbetes, a haematological disorder or a central nervous system (CNS) disorder. In particular, these are useful for treating anaemia, neutropaemia, thrombocytopaemia, Alaheimer's disease, parkinson's disease putative fatty acid-CoA ligase fadD26 (acy1-COA synthetase), which is given in comparison with (I) in the present invention
                                                                                                                                                                                                                                                                                                                  neuroprotective; analgesic; antiparkinsonian; haemostatic; antianaemic; immunostimulant; anorectic; antidabetic; gene therapy; obesity; anaemia; diabetes; hematological disorder; central nervous system disorder; neutropaenia; thrombocytopaenia; Alzheimer's disease; pain;
                                                                                                                                                                                                                                                                                               fatty acid CoA ligase-like AMP-binding enzyme; enzyme; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New genes and its encoded fatty acid CoA ligase-like AMP-binding enzyme (FACLAMP-BE), useful for identifying modulators of FACLAMP-BE activity, and in gene therapy for treating e.g. obesity, diabetes, anemia,
                                                                                                                                                                                                                                                         M. tuberculosis putative fatty acid-CoA ligase fadD26 SEQ ID NO:4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 583;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 42; DB 7; Length 583

The present sequence is given in a specification relating to a method for screening a library of mutants. The method comprises constructing a library of mutants. The method comprises constructing a library of mutants in genes and/or regulatory respons of the organisms of interest, where the insertion contains a tag and/or a transposon associated with a tag. The mutants are identified by hydridisation of the tags to known sequences. The method is useful for reating an individual suffering from a mycobacterial infection, suspected of being infected with a Mycobacterium, or having been exposed to an infectious Mycobacterium. It is also useful for identifying been exposed isolating mutants of actinomycetales and for identifying compounds that have antibiotic activity. The method is used to identify mutants of microorganisms, preferably an actinomycetales, such as M. tuberculosis, M. bovis, M. leprae, M. avium, M. intracellulaire and M. paratuberculosis, that is unable to grow under specific conditions. It is useful in constructing vaccines. The method can be used to screen multiple libraries concurrently. It can screen libraries of different strains of the same organism. The present protein is encoded by a gene which is disrupted by the insertion of the 1S 1096 transposon to produce an attenuated mutant of Mycobacterium tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
Screening a mutant library for mutants unable to grow under specific conditions and for identifying loci involved in pathogenicity, comprises using signature tagged transposon mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated mycobacterial peptide (1), or its fragment, variant or derivative encoded by a gene whose expression is induced or up-regulated during culture of a mycobacterium under continuous culture conditions of a dissolved oxygen tension of a dissolved oxygen tension of a dissolved oxygen tension of up to 10% air saturation measured at 37 plus degrees Celsius when compared with a dissolved oxygen tension of up to 10% air saturation measured at 37 plus degrees Celsius when compared with plus degrees Celsius. (1) has tuberculostatic activity and can be used in vacchnes. The mycobacterial peptide (1) or its fragment, variant or derivative, inhibitor, antiblody, attenuated mycobacterium, attenuated microbial carrier, DNA sequence, DNA plasmid, RNA sequence, or RNA vector from the present invention can be used for manufacturing a medicament for treating or preventing a mycobacterial infection. The peptide or its fragment, variant or derivative, the antibody, or a polymucleotide probe comprising at least 8 nucleotides, where the probe binds to at least a comprising an weobacterial infection. The present sequence represents a mycobacterial antigen, which is useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                               New isolated mycobacterial peptide encoded by a gene that is induced or up-regulated under high oxygen tension, useful for diagnosing, treating or preventing a mycobacterial infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABR72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

The invention relates to a human monoclonal antibody or its antigen binding fragments, which exhibit immunological binding affinity for a hepatitis c virus (HCV) El antigen, compitising an anino acid sequence homologous to the binding portion of a human antibody Pab molecule from a combinatorial antibody library. The vaccine composition comprising the antibodies or antigen binding fragments against HCV El or E2 antigen or its hypervariable region is useful in treading or preventing HCV infection in a subject. Sequences ABG76513-ABG76568 represent human monoclonal antibodies against HCV El antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Virucide; human; immunopolypeptide; immunopeptide; envelope glycoprotein; nonstructural protein; hepatitis C virus; HCV; E2 glycoprotein; NS3 protein; viral infection.
                                                                              comprising a human monoclonal antibody against hepatitis C virus or E2 antigen, useful for treating or preventing HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human immunopeptide to HCV E2 glycoprotein Fab variable region #53.

infection

```
The invention relates to 446 newly isolated polymucleotide sequences. The activity of polymucleotides of the invention may be described as, vulnerary, neuroprotective, immunomodulator, cytostatic and anti-inflammatory. Compositions comprising nucleic acids of the invention are useful for treating a mammalian subject, or as nutritional sources or supplements. These are useful in gene therapy, particularly for treating wounds, burns or ulcers, Alzahmer's disease, Huntington's disease, amyorrophic lateral sclerosis, autoimmune disorders, cancer or inflammation. The nucleic acids and polypeptides are also useful in diagnostic and research methods. The sequences given in records ABB43544-invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
envelope glycoprotein E2 and nonstructural protein NS3 of hepatitis C virus (HCV). E2 glycoprotein is believed to be responsible for target cell binding and contains neutralising epitopes, while NS3 is thought to be involved in the replication of HCV. The immunopolypeptides are useful for diagnosing and treating a patient having or suspected to be having
